

Atos Environmental Policy Principles

Based on a double materiality approach, Atos is committed to a more decarbonized and sustainable digital space by addressing both the environmental impacts on its value chain, its own operations and strategy and the effects of its activities on the environment.

The Environmental Policy covers all employees, managers, subcontractors, suppliers, and key partners of the Group who commit to respecting it. To meet its commitments, Atos adopts the 8 following high-level principles ⁽¹⁾.

1 Compliance

Identify, monitor and comply with all relevant environmental laws, regulations, standards and stakeholder requirements relating to the environmental aspects of our operations.

2 Global challenges

Address our material environmental challenges ⁽²⁾ (GHG emissions, climate change adaptation, resource use, waste and circular economy) by setting reduction targets and building resilience against environmental risks.

3 Local specific challenges

Identify and address site or country specific environmental risks and challenges (products, logistics, waste management, recycling, recovery, water, etc.).

4 Initiatives and action plans

Implement and monitor initiatives, action plans and training for all Group employees to steadily progress on key aspects and challenges.

5 Environmental protection

Prevent pollution and protect the environment through a Group-wide Environmental Management System and ISO 14 001 certified on main sites with appropriate procedures and controls.

6 Atos Value Chain ⁽³⁾

Ensure that suppliers, contractors, and key partners respect this Policy and actively contribute to our environmental progress, through responsible procurement practices, environmental targets and performance assessments.

7 Performance monitoring

Annually track key performance indicators and progress against group and local objectives and drive continuous improvement through audited third-party reviews.

8 Awareness and Communication

Engage stakeholders through transparent communication ⁽²⁾ and reports aligned with major standards such as CSRD, TCFD, GRI, and EU Taxonomy.
